Ankylos® implant system  
- Clinical documentation

Well documented, reliable and safe
- More than 9,000 patients followed up to 20 years
- > 98% implant survival rate at 5 years of follow-up
- Stable bone levels after 5 to 12 years of follow-up

The TissueCare Concept behind the clinical success
The Ankylos implant system is scientifically and clinically proven to maintain hard and soft tissue over time. This is achieved by the unique combination of the following features:
- one conical implant-abutment connection, e.g. One-fits-all
- horizontal offset creating the SoftTissue Chamber
- microstructured Friadent Plus surface on the implant shoulder
- progressive thread design allowing for immediate loading

Published data shows that placement of Ankylos implants is safe and predictable in both jaws, for indications such as:
- single tooth restorations
- fixed partial/full restorations, intra oral welded
- overdentures retained by SynCone abutments

Further topics and concepts are well documented such as:
- placement in extraction sockets
- implant stability and immediate loading protocol
- patient satisfaction/esthetic evaluation
- bone level evaluation

Conclusion
Extensive long-term documentation evaluating > 16,000 implants, shows implant survival rate of >98% after 5 years or more of follow-up. It can be concluded that the Ankylos implant is safe and predictable over long time.
